1406. HOUSTEK J., HLOUSKOVÁ Z., ŠTOLOVÁ O. and WELLNEROVÁ M. #21
běh a výskyt pneumonií v Pražském kraji v r. 1952 a v. I. pololetí 1953.
The course and incidence of pneumonia in the Prague
area during 1952 and the first half year of 1953 PEDIAT.
LISTY 1954, 9/4 (202-204) Tables 1

As autopsy is carried out in all children dying during the first year of life - in 1953 autopsy was even performed in all patients who died under 3 years of age - the number of deaths due to pneumonia can be established more precisely. Infant mortality decreased from 40 ‰ in 1952 to 33.9 ‰ in 1953 (first half year, in which the highest absolute figures are observed). More than half concerned neonatal death due to pneumonia, in premature children and in infants with congenital defects.

CZECHOSLOVAKIA / Human and Animal Morphology (Normal and Pathological). S
Skeleton.

Abs Jour : Ref Zhur - Biol., No 21, 1958, No 97158
 Author : Houstek, J.; Janele, J.; Rubin, A.; Snobl, O.
 Inst : Not given
 Title : Bone Changes in Diseases of the Blood in Childhood.
 Orig Pub : Ceskosl. rentgenol., 1957, 11, No. 2, 86-99
 Abstract : The skeleton of children with acute leukemia (166 cases),
 chronic myelosis (11), lymphogranulomatosis (25) and
 hemolytic anemia (21) was studied roentgenologically.
 The changes in the form of lucid intervals, osteolytic
 foci and periostosis were noted in 66% of cases, first
 of all in the region of metaphyses, mostly in the bones
 of the calf, distal metaphysis of the femur, distal
 metaphyses of bones of the forearm and in the bones of
 the wrist. In chronic courses, sclerotic changes were

Card 1/2

CZECHOSLOVAKIA / Human and Animal Morphology (Normal and Pathological). S
Skeleton.

also determined. In babies, the changes were less
 sharply pronounced. In chronic myelosis, changes were
 observed in 4 cases: multiple sclerosis (2), platy-
 spondylisis (1), and osteolysis (1). In lymphogranu-
 lomatosi, changes were discovered in 6 cases: osteolysis
 (3), sclerosis (2) and periostosis (1). In hemolytic
 anemia, changes were noted in 6 cases - dilation of
 skull diploe or the intra-osseous spaces of tubular
 bones.

Prague, Casopis Lekaru Ceskych, Vol 105, No 39, 23 Sep 66, pp 1047 - 1052

Abstract [Authors' English summary modified]: The syndrome of the disease as observed in 2 brothers is discussed; the elder died at the age of 13, the younger at the age of 2½. Immunochemical examination showed marked changes in immunoglobulins, with a drop in IgM and an increase in IgA, and the presence of a paraprotein of the IgG-L type. These and other data indicate that the disease is a special case of hereditary immunological deficiency. 7 Figures. 41 Western. 3 Czech references.

On the basis of 3 separate observations attention is called to the diagnostic difficulties of some oedematous states in the facial region. Of these cases, the correct diagnosis was arrived at only after prolonged and repeated detailed total observation. The cases presented: (1) Besnier-Boeck-Schaumann disease with skin manifestations in the region of the jaw; (2) an inflammatory complication after a tooth extraction, with the later development of an abscess; (3) hypophyseal tumour with allergic signs of myxoedema. Attention is called to possible errors in the differential diagnosis and the importance of complex examination is stressed.

„Automatyczny kolektor frakcji AKF-1”. Podstawy Automatyka-

-Kontrola. No. 4, 1958, pp. 145-146, 3 figs.

Automatic fraction collectors are used for research and technical purposes in chemistry, biochemistry and related sciences. This article describes a collector designed at the Wrocław Polytechnic and explains its electrical system and mechanical construction. The AKF-1 collector has a conduction feeler which enables drop dosing of the fraction within the limits of from 1 to 99 drops. The collector's disc is provided with 64 test-tubes. The disc is driven by an electric motor through a worm-disc gear. Attachments to the AKF-1 collector which will enable the use of time and volumetric feelers are in the process of being designed.

„Badanie elektrod chlorosrebrnych metoda elektrod proszkowych”. Przemysł Chemiczny. No. 2, 1958, pp. 77—83, 7 tabs.

Several powder electrodes containing metallic silver and silver chloride, as a powdered phase, were examined. The electrodes were distinguished by various sizes of silver grain (coarse grained or fine grained) and different methods of preparing the silver chloride. In some cases, the silver wire was substituted for the powdered phase of silver and it formed simultaneously the leading out electrode. It was found that in solution of potassium chloride (0.5 and 0.01 N) the electrodes containing silver wires and coarse grained powder showed higher potentials than the electrodes containing fine grained silver; a contrary phenomenon occurred in hydrochloric acid (0.01 N) and in 1 N K_2SO_4 solutions (the powder electrodes composed). The influence of silver chloride was observed only in the absence of silver crystals in the electrode and of chloride ions in the electrode liquid, and — only in the initial period. The results indicated the permanent and decisive influence of the silver surface of the potential of silver — silver chloride

electrodes. The conditions of possible standardization of electrodes are discussed in this article.

AUTHOR: Houzin, Vladimír (A); Zeman, Pavel

ORG: Institute of Mineral Raw Materials, Kutná Hora (Ústav nerostných surovin)

TITLE: Accelerated determination of the total sulphur content in fuels

SOURCE: Chemický průmysl, no. 3, 1966, 167-169

TOPIC TAGS: sulfur, fuel, fuel contamination

ABSTRACT: The authors describe an analytical process designed to determine the total content of sulphur in fuels. The procedure is a modified Eschkov method. The advantage of the new procedure is that it is equally accurate and at the same time faster. The Eschkov method is highly accurate ($\pm 2\%$ of the sulphur content which can be determined), but takes too much time. This applies in particular to the gravimetric determination of sulphates. In order to accelerate the analytical part of the method, the authors replaced the final determination of sulphates on scales by complexometric determination of surplus ions Ba^{2+} after elimination of barium sulphate or by determining the sulphates by means of benzidine-hydrochloride and alkalimetric titration of the resulting insoluble benzidine sulphate. The article describes in detail the two methods and compares the results to those obtained by the Eschkov method. Both methods are easy to apply. The mean error of the abbreviated complexometric modification is $\pm 1.4\%$, and of the abbreviated benzidine-sulphate modification, $\pm 2.05\%$. The

UDC: 662.62:54

Cord 1/2

ACC NR: AP6021338

determination of sulphates by means of benzidine-hydrochloride is particularly advantageous from the point of view of savings of time. In a series of ten samples the savings of time amounted to nine hours as compared to the existing method of determining the total sulphur content according to the Czechoslovak standard CSN 44 1350. The abbreviated modification of the Eschkov method is reliable when the sulphur content is 1% and over. Orig. art. has: 2 tables.

"Distribution and Elimination of Chloramphenicol After Rectal
Application."

Prague, Casopis Lekaru Ceskych, Vol C11, No 38, 20 September 65,
pp 1046-1050.

Abstract [Author's English summary, modified]: The distribution
was studied of chloramphenicol in suppositories of Czechoslovak
and foreign make (Syntomycetin Lepetit) in comparison with intra-
muscular and peroral application of this antibiotic.

The Czechoslovak suppositories give low blood and urine
levels of chloramphenicol, and the chloramphenicol resorption
is insufficient. Only suppositories with an experimental hydro-
phile base give somewhat higher blood levels of chloramphenicol
and enable better resorption, but even in that case the levels
attained and resorption do not equal those after intramuscular
or peroral application of chloramphenicol. Nine references, in-
cluding 4 Czech.

"Influence of Ascorbic Acid on the Excretion of Penicillin V in Potassium Salt."

Prague, Casopis Lekarů Ceských, Vol CII, No 40, 4 October 63, pp 1089-1094.

Abstract [Authors' English summary, modified]: Studied was the influence of ascorbic acid on the excretion of penicillin V in potassium salt in healthy and sick individuals at different time intervals after the administration of a single dose of the following preparations: 1. Penicillin V - potassium salt 200,000 i.u. + 200 milligrams of ascorbic acid; 2. penicillin V - potassium salt 200,000 i.u. + 250 milligrams of ascorbic acid; 3. penicillin V - potassium salt 200,000 + 400 milligrams of ascorbic acid. Results were compared with the excretion of penicillin V of potassium salt without ascorbic acid. T-tests were applied to evaluate all findings by a statistical method. Seventeen references, including 7 Czech and 3 Russian.

AUTHOR: Hoványi, L.

TITLE: A new trend in development of independent mining triangulation networks

PERIODICAL: Referativnyy zhurnal, Geodeziya, no. 2, 1963, 18, abstract 2.52.125 ("Nehézipari műsz. egyet. közl.", 1962, v. 22, 81 - 92, German; English and Russian summaries)

TEXT: In Hungary is valid the "Instruction for performing mine surveying operations" which provides for calculating the coordinates of mine triangulation points in the all-state system with tying the networks to the points of the 4th-class state triangulation; the coordinates of these latter are assumed to contain no errors. Since the actual position of initial points is determined with errors, the precision of mine triangulations turns out often insufficient for carrying out some important works, e.g., driving workings with faces toward one another. The draft of a new Hungarian instruction for performing mine surveying operations provides for the formation of independent mining triangulation

networks. A line connecting two points of the state triangulation, incorporated into the mining network, is adopted as a conditional base whose length, for the sake of simplifying further calculations, must be expressed in the same units in which all directly measured lines in the given region are expressed. Therefore, the length of the conditional base must be calculated not from coordinates of the initial points, but from the base network one of whose sides is measured directly with an accuracy of the order of 1:30,000. Problems of adjusting base networks are considered and examples are presented. It is pointed out that there is no sense, in adjusting mining triangulation networks, to employ exact methods. In order to achieve the necessary accuracy of a network, it is more expedient to increase the number of measurements of each angle and improve the precision of instrument centering at the observation points.

TITLE: The accuracy of orientation of mine surveys by means of a connecting quadrangle

PERIODICAL: Referativnyy zhurnal, Astronomiya i Geodeziya, no. 11, 1962, 14, abstract 11G109 ("Bányász. lapok", 1962, v. 95, no. 5, 329 - 334, Hungarian; Russian, German, and English summaries)

TEXT: The methods of determining the accuracy of angular measurements in the connecting quadrangle proposed by D. N. Ogloblin and A. P. Belokry's are critically analyzed. The author derives formulae for re-calculation (at a prescribed accuracy of orientation) of admissible errors in measuring angles in the connecting quadrangle. An example is presented. Orig Pub : Sbor. Ceskosl. Akad. Zemed. Ved. Zivoc. Vyroba, 1956, 29, No 9, 649-680

Abstract : The tests were conducted with a group of four pigs of mixed breed (1/4 blood of a wild pig) of one litter 131 days old, the average live weight 37.85 kg, and with a group of four selectively bred white piglets 128 days old, live weight 46.25 kg. The physiological experiments, lasting 64 days, gave the following results: the average live weight of the mixed breed 68.35 kg, purebred 81.10 kg; correspondingly, the daily increase in weight 477g and 546 g; the digestibility coefficient (DC) of dry substances in the feed 74.18 and 76.18; DC of feed protein 76.28 and 80.88; DC of fat 58.0 and 61.2; DC of cellulose 33.52 and 39.01; DC of nitrogen-free extractable substances 83.6 and 84.83; DC of minerals 46.96 and 47.14; nitrogen utilization 72.41 and 76.13%; Ca utilization 56.57 and 55.49; P - 23.07 and 29.21%; the feed-

Abstract : ding units outlay for 1 kg of weight increase, 3.671 and 3.331 kg on the basis of barley. The average weight of mixed breed (after fattening) at the age of 289 days 120.74 kg; and purebred at the same age 140.75 kg; slaughter weight 78.43 and 78.35 percent; the length of intestines 22.92 and 25.85 m.

The better results in the purebred group are explained by the author by the larger length of their intestines.
